

# Skogán®

finest Scandinavian collection

## Skogán reconstituted birch veneer

Skogán reconstituted birch veneers are unique! You can see the lively stripes of the veneers. All the raw materials are sourced from sustainable managed forests in Scandinavia.

### Skogán reconstituted birch veneer advantages

- There are no similar products to our Skogán reconstituted Birch veneers; as our veneers are kind of between natural veneers and engineered veneers. **Our veneers are made of 1,5 mm single dyed birch veneers.**
- Own unique dyeing process differs from other dyeing methods. We are using **environmental friendly** processes, where **no harmful chemicals** are being used.
- **No bleaching; No tropical woods.** Our colours are **water-based**.
- The glue used in the process of the veneers is **ultra low emitting amino glue**, which has extremely low formaldehyde level. The veneers are pressed without formaldehyde on all available wood based substrates.
- Because of the ecological production process our veneers have kept **all the characters of wood**, and we also want that it shows: some characters of wood are allowed to some extend, like healthy knots and brown stripes.
- A big advantage is also our **visual appearance** – in our veneers one can see clearly individual veneer stripes, which makes surface lively and it reflects light in an unparalleled way. This is because our reconstituted veneers are produced from thicker raw material - 1,5 mm birch veneer layers - where the common engineered veneer producers are using 0,6 mm poplar, ceiba or other tropical species.
- We are not aiming to imitate any natural wood species, but we want to highlight beautiful **Scandinavian design**: “pure, clean and simple”. Typical Skogán!
- Skogán reconstituted birch veneers are not travelling long distances, but coming from Scandinavian sustainable managed forests. Skogán reconstituted birch veneered panels are FSC certified.
